AUTHOR: Zysina-Molozhen, L. M.

TITLE: Calculation of the thermal boundary layer in a flow of compressible gas

PERIODICAL: Inzhenerno-fizicheskii zhurnal, no. 6, 1962, 21 - 26.

TEXT: The author suggested a semiempirical approximation method for a sufficiently accurate determination of the laminar, the transition, and the turbulence zones of a boundary layer formed in the flow of compressible gas round a surface. On the basis of the integral energy equation expressed in variables according to Dorodnitsyn for a plane flow of compressible gas, the equation

$$\frac{d\delta_r^{**}}{dx} + \frac{U_0'}{U_0} \delta_r^{**} = \frac{T_0'}{T_\infty} (1 - \alpha_0^2)^{\frac{k}{k-1}} \frac{Nu_x}{Pr Re_x} \quad (7)$$

was derived, and the parameters

Card 1/3

$$Gr = \frac{U_0'}{U_0} \delta_r^{**} Gr, \quad (8)$$

Calculation of the thermal ...

and

$$\chi = \frac{T_0}{T_w} (1 - \alpha_0^2)^{\frac{k}{k-1}} \frac{Nu_x}{Pr Re_x} G_r$$

(9)

were introduced on the assumption that they change along the surface under flow and that they clearly define all characteristics of the boundary layer. Under certain conditions, G_T was found to be equal for flows round a profile or a plate. A formula analogous to that for incompressible flows was found for G_T . A comparison of the equation derived for calculating local heat transfer numbers for compressible flow with the corresponding equation for incompressible flow showed a formal similarity between the equations for calculating the intensity of heat transfer in compressible and incompressible gas flows. The comparison of these equations yields the relation

$$Nu_x = Nu'_x \left[\frac{1 - \alpha_\infty^2}{1 - \alpha_0^2} \right]^{\frac{k}{k-1}} = Nu'_x \left[\frac{1 - \frac{k-1}{2} \lambda_\infty^2}{1 - \frac{k-1}{2} \lambda_0^2} \right]^{\frac{k}{k-1}} \quad (21),$$

Card 2/3

which shows $Nu_x = Nu'_x$ for $\alpha_0 = \alpha_\infty$ or $\lambda_0 = \lambda_\infty$. This is in agreement with experimental results. ρ_0^* is the density corresponding to the braking parameters, U_0 is the velocity, and T_0 the temperature outside the boundary layer, T_w the wall temperature; the asterisk corresponds to the braking parameters. There are 2 figures.

coefficient

ABSTRACT: The article gives the results of an experimental determination of
the mean values of the heat transfer coefficients on the end wall of an inter-
blade channel. All measurements of the thermal and dynamic characteristics
of the flow were made on the three central blades of the turbine and in the
channels formed by them. The end walls of these three channels constituted
heat absorbing surfaces cooled by water in a flow type calorimeter.

Card 1/3

L 11478-66
ACC. NR. AT6001356

The side, end, and lower walls of the calorimeter were covered with a layer of insulation which practically excluded heat transfer between the air medium around the calorimeter and the cooling water. The heat transfer coefficient was determined by the formula:

$$\alpha = \frac{Q}{F(t_g - t_w)}$$

where Q is the heat flux through the end wall; F is the surface of the end wall; t_g is the mean temperature of the gas in the channel; and t_w is the averaged surface temperature of the end wall. The distribution of the static pressure along the outlet of the profile and at the end wall of the interblade channel, as well as at a given distance from the inlet section of the cascade, were measured by a water-filled manometer. The total pressure was measured in the entrance to the accelerating convergent section by a conventional Prandtl tube. Experimental results are exhibited in several figures. For approximate calculations of the intensity of heat transfer on the end walls of interblade channels, these formulas are recommended:

$$\text{Nu} = C_1 \text{Re}^{0.5} \text{ at } \text{Re} < 6 \cdot 10^4$$

$$\text{and } \text{Nu} = C_{\text{turb}} \text{Re}^{0.8} \text{ at } \text{Re} > 10^5$$

where C is a variable characteristic parameter. Orig. art. has 4 formulas and 5 figures.

TOPIC TAGS: turbulent boundary layer, convective heat transfer, gas flow, compressible gas

ABSTRACT: The aim of the article is stated to be a theoretical and experimental investigation of the effect on the structure of the turbulent boundary layer, in particular, on the thickness of the laminar sublayer, of the Mach number and the temperature factor, to evaluate their effect on the final result of calculations of the resistance of the plate, and to make more precise the initial hypotheses of the semi-empirical theory. The experimental investigations of the effect of the

Card 1/2

L 24245-66

ACC NR: AT6006917

temperature factor on heat transfer and surface resistance in a stream of compressible gas were carried out in the optical unit of a supersonic aerodynamic tube. The experiments were made over a range of the temperature factor from 1.0 to 2.2 at a Mach number of approximately 1.5 and a Reynolds number of 10^7 . The length of the working section was 0.5 meters. Results are exhibited in a series of curves. It was found that at values of the temperature factor substantially less than unity, it is necessary to take into account the dependence of the thickness of the laminar sublayer on the Mach number, and particularly on the temperature factor. At values of the temperature factor less than unity, the effect of the Mach number and the temperature factor on the turbulent transfer constants can in practice be neglected. When the Mach number is less than 3.0, this leads to a decrease in the resistance coefficient by not more than 20%. Orig. art. has: 5 formulas and 6 figures.

TITLE:

Heat transfer in turbine blading

PERIODICAL:

Teploenergetika, no.7, 1962, 77-80

TEXT:

The nature of gas flow between gas turbine blades is such that the heat-transfer coefficient can assume very different values at different places and this can give rise to unexpected temperature gradients in the blades. Only approximate methods of calculation are available for assessing this effect in cooled blades. Local values of the heat-transfer coefficient were calculated for root, middle and tip sections of a twisted blade, and considerable variations were found both across and along the blades. The temperature distribution in the blades was then calculated by two methods, one employing an average heat-transfer coefficient and the other dividing the blade up into four sections each with its own value of heat-transfer coefficient. The differences between the results obtained by the two methods were particularly great at high rates of cooling; thus at a rate of

Card 1/3

Heat transfer in turbine blading

S/096/62/000/007/002/002
E194/E455

40 kcal/hour the difference near the blade root is 20°C; at 200 kcal/hour it is 95°C. A still greater difference would be found if the blade were divided into smaller sections. The calculation confirms that blade root cooling influences the blade temperature distribution only in the bottom quarter of the blade. The influence of cooling is important at heat transfer rates above 100 kcal/hour; here the calculation based on average heat-transfer coefficient is inaccurate and overestimates the benefits of cooling. In calculating heat transfer from the blade ends the usual boundary layer methods are not strictly valid because of interaction between the boundary layers of the blade end and those of the adjacent stationary wall. However, analysis shows that this interaction has little effect on heat transfer unless the blade pitch and boundary layer thickness are commensurate which, in practice, can occur only in rather special cases. To check the calculations tests were made in a flow of air at 200°C with stationary flat rows of blades water-cooled near the roots. Temperature and velocity distributions were measured and agreement with theory was good; in particular, the effect of interaction

between boundary layers was negligible. There are 5 figures.

A M

ZUKÓWNA (ZONIA). Przewidywania do Sory mikrobiologicznej rezerwy
 jodłowej w rezerwacie Yata w Nadleśnictwie Państwowym Łuków.
 [Contribution to the mycological flora of the Silver fir reserve at
 Yata in the government forests of Łuków.]—*Tram. Inst. Rech. For.
 doman. Varsovie*, Ser. A, 21, 27 pp., 16 pl., 43 fig., 1938. [French
 summary. Received April 1938.]

The author gives a carefully annotated list of 30 fungi (29 Polypores)
 found on various trees in the silver fir (*Abies pectinata*) [*A. alba*] reserve
 at Yata, near Łuków, Poland, illustrated with drawings of cystidia and
 spores of each species and a number of photographs of the sporophores
